- Content may include statistical data, catalogs, directions, design criteria, conference papers and proceedings, literature reviews, or bibliographies.
- Publication may involve a variety of printing and binding methods.

The SATCOM report (National Academy of Sciences - National Academy of Engineering, 1969) lists the following characteristics of the technical report:

- It is written for an individual or organization that has the right to require such reports.
- It is basically a stewardship report to some agency that has funded the research being reported.
- It permits prompt dissemination of data results on a typically flexible distribution basis.
- It can convey the total research story, including exhaustive exposition, detailed tables, ample illustrations, and full discussion of unsuccessful approaches.

History and Growth of the U.S. Government Technical Report

The development of the [U.S. government] technical report as a major means of communicating the results of R&D, according to Godfrey and Redman (1973), dates back to 1941 and the establishment of the U.S. Office of Scientific Research and Development (OSRD). Further, the growth of the U.S. government technical report coincides with the expanding role of the Federal government in science and technology during the post World War II era. However, U.S. government technical reports have existed for several decades. The Bureau of Mines Reports of Investigation (Redman, 1965/66), the Professional Papers of the United States Geological Survey, and the Technological Papers of the National Bureau of Standards (Auger, 1975) are early examples of U.S. government technical reports. Perhaps the first U.S. government publications officially created to document the results of federally funded (U.S.) R&D were the technical reports first published by the National Advisory Committee for Aeronautics (NACA) in 1917.

Auger (1975) states that "the history of technical report literature in the U.S. coincides almost entirely with the development of aeronautics, the aviation industry, and the creation of the NACA, which issued its first report in 1917." In her study, *Information Transfer in Engineering*, Shuchman (1981) reports that 75% of the engineers she surveyed used technical reports; that technical reports were important to engineers doing applied work; and that aerospace engineers, more than any other group of engineers, referred to technical reports. However, in many of these studies, including Shuchman's, it is often unclear whether U.S. government technical reports, non-U.S. government technical reports, or both are included.

The U.S. government technical report is a primary means by which the results of federally funded R&D are made available to the scientific community and are added to the literature of

science and technology (President's Special Assistant for Science and Technology, 1962). McClure (1988) points out that "although the [U.S.] government technical report has been variously reviewed, compared, and contrasted, there is no real knowledge base regarding the role, production, use, and importance [of this information product] in terms of accomplishing this task." Our analysis of the literature supports the following conclusions reached by McClure:

- The body of available knowledge is simply inadequate and noncomparable to determine the role that the U.S. government technical report plays in transferring the results of federally funded R&D.
- Further, most of the available knowledge is largely anecdotal, limited in scope and dated, and unfocused in the sense that it lacks a conceptual framework.
- The available knowledge does not lend itself to developing "normalized" answers to questions regarding U.S. government technical reports.

THE TRANSFER OF FEDERALLY FUNDED AEROSPACE R&D AND THE U.S. GOVERNMENT TECHNICAL REPORT

Three paradigms -- appropriability, dissemination, and diffusion -- have dominated the transfer of federally funded (U.S.) R&D (Ballard, et al., 1989; Williams and Gibson, 1990). Whereas variations of them have been tried within different agencies, overall Federal (U.S.) STI transfer activities continue to be driven by a "supply-side," dissemination model.

The Appropriability Model

The appropriability model emphasizes the production of knowledge by the Federal government that would not otherwise be produced by the private sector and competitive market pressures to promote the use of that knowledge. This model emphasizes the production of basic research as the driving force behind technological development and economic growth and assumes that the Federal provision of R&D will be rapidly assimilated by the private sector. Deliberate transfer mechanisms and intervention by information intermediaries are viewed as unnecessary. Appropriability stresses the supply (production) of knowledge in sufficient quantity to attract potential users. Good technologies, according to this model, sell themselves and offer clear policy recommendations regarding Federal priorities for improving technological development and economic growth. This model incorrectly assumes that the results of federally funded R&D will be acquired and used by the private sector, ignores the fact that most basic research is irrelevant to technological innovation, and dismisses the process of technological innovation within the firm.

The Dissemination Model

The dissemination model emphasizes the need to transfer information to potential users and embraces the belief that the production of quality knowledge is not sufficient to ensure its fullest

use. Linkage mechanisms, such as information intermediaries, are needed to identify useful knowledge and to transfer it to potential users. This model assumes that if these mechanisms are available to link potential users with knowledge producers, then better opportunities exist for users to determine what knowledge is available, acquire it, and apply it to their needs. The strength of this model rests on the recognition that STI transfer and use are critical elements of the process of technological innovation. Its weakness lies in the fact that it is passive, for it does not take users into consideration except when they enter the system and request assistance. The dissemination model employs one-way, source-to-user transfer procedures that are seldom responsive in the user context. User requirements are seldom known or considered in the design of information products and services.

The Knowledge Diffusion Model

The knowledge diffusion model is grounded in theory and practice associated with the diffusion of innovation and planned change research and the clinical models of social research and mental health. Knowledge diffusion emphasizes "active" intervention as opposed to dissemination and access; stresses intervention and reliance on interpersonal communications as a means of identifying and removing interpersonal barriers between users and producers; and assumes that knowledge production, transfer, and use are equally important components of the R&D process. This approach also emphasizes the link between producers, transfer agents, and users and seeks to develop user-oriented mechanisms (e.g., products and services) specifically tailored to the needs and circumstances of the user. It makes the assumption that the results of federally funded R&D will be under utilized unless they are relevant to users and ongoing relationships are developed among users and producers. The problem with the knowledge diffusion model is that (1) it requires a large Federal role and presence and (2) it runs contrary to the dominant assumptions of established Federal R&D policy. Although U.S. technology policy relies on a "dissemination-oriented" approach to STI transfer, other industrialized nations, such as Germany and Japan, are adopting "diffusion-oriented" policies which increase the power to absorb and employ new technologies productively (Branscomb, 1991; Branscomb, 1992).

The Transfer of (U.S.) Federally-Funded Aerospace R&D

A model depicting the transfer of federally funded aerospace R&D through the U.S. government technical report appears in figure 1. The model is composed of two parts -- the informal that relies on collegial contacts and the formal that relies on surrogates, information producers, and information intermediaries to complete the "producer to user" transfer process.

When U.S. government (i.e., NASA) technical reports are published, the initial or primary distribution is made to libraries and technical information centers. Copies are sent to surrogates for secondary and subsequent distribution. A limited number of copies are set aside to be used by the author for the "scientist-to-scientist" exchange of information at the collegial level.

Surrogates serve as technical report repositories or clearinghouses for the producers and include the Defense Technical Information Center (DTIC), the NASA Center for Aero Space

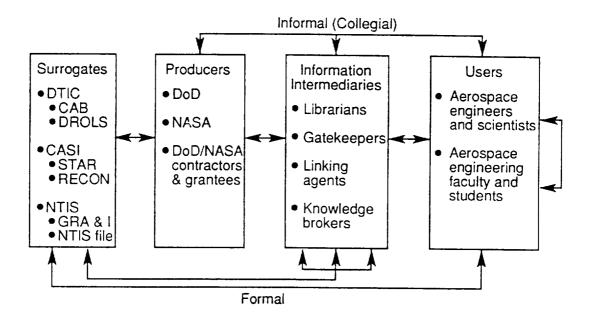

Figure 1. The U.S. Government Technical Report in a Model Depicting the Dissemination of Federally Funded Aerospace R&D.

Information (CASI), and the National Technical Information Service (NTIS). These surrogates have created a variety of technical report announcement journals such as CAB (Current Awareness Bibliographies), STAR (Scientific and Technical Aerospace Reports), and GRA&I (Government Reports Announcement and Index) and computerized retrieval systems such as DROLS (Defense RDT&E Online System), RECON (REsearch CONnection), and NTIS On-line that permit online access to technical report data bases. Information intermediaries are, in large part, librarians and technical information specialists in academia, government, and industry. Those representing the producers serve as what McGowan and Loveless (1981) describe as "knowledge brokers" or "linking agents." Information intermediaries connected with users act, according to Allen (1977), as "technological entrepreneurs" or "gatekeepers." The more "active" the intermediary, the more effective the transfer process becomes (Goldhor and Lund, 1983). Active intermediaries move information from the producer to the user, often utilizing interpersonal (i.e., face-to-face) communication in the process. Passive information intermediaries, on the other hand, "simply array information for the taking, relying on the initiative of the user to request or search out the information that may be needed" (Eveland, 1987).

The overall problem with the total Federal STI system is that "the present system for transferring the results of federally funded STI is passive, fragmented, and unfocused;" effective knowledge transfer is hindered by the fact that the Federal government "has no coherent or systematically designed approach to transferring the results of federally funded R&D to the user" (Ballard, et al., 1986). In their study of issues and options in Federal STI, Bikson and her colleagues (1984) found that many of the interviewees believed "dissemination activities were afterthoughts, undertaken without serious commitment by Federal agencies whose primary

concerns were with [knowledge] production and not with knowledge transfer;" therefore, "much of what has been learned about [STI] and knowledge transfer has not been incorporated into federally supported information transfer activities."

Problematic to the **informal** part of the system is that knowledge users can learn from collegial contacts only what those contacts happen to know. Ample evidence supports the claim that no one researcher can know about or keep up with all the research in his/her area(s) of interest. Like other members of the scientific community, aerospace engineers and scientists are faced with the problem of too much information to know about, to keep up with, and to screen. Further, information is becoming more interdisciplinary in nature and more international in scope.

Two problems exist with the **formal** part of the system. First, the **formal** part of the system employs one-way, source-to-user transmission. The problem with this kind of transmission is that such formal one-way, "supply side" transfer procedures do not seem to be responsive to the user context (Bikson, et al., 1984). Rather, these efforts appear to start with an information system into which the users' requirements are retrofit (Adam, 1975). The consensus of the findings from the empirical research is that interactive, two-way communications are required for effective information transfer (Bikson, et al., 1984).

Second, the formal part relies heavily on information intermediaries to complete the know-ledge transfer process. However, a strong methodological base for measuring or assessing the effectiveness of the information intermediary is lacking (Beyer and Trice, 1982). In addition, empirical data on the effectiveness of information intermediaries and the role(s) they play in knowledge transfer are sparse and inconclusive. The impact of information intermediaries is likely to be strongly conditional and limited to a specific institutional context.

According to Roberts and Frohman (1978), most Federal approaches to knowledge utilization have been ineffective in stimulating the diffusion of technological innovation. They claim that the numerous Federal STI programs are "highest in frequency and expense yet lowest in impact" and that Federal "information dissemination activities have led to little documented knowledge utilization." Roberts and Frohman also note that "governmental programs start to encourage utilization of knowledge only after the R&D results have been generated" rather than during the idea development phase of the innovation process. David (1986), Mowery (1983), and Mowery and Rosenberg (1979) conclude that successful [Federal] technological innovation rests more with the transfer and utilization of knowledge than with its production.

THE INFORMATION-SEEKING BEHAVIOR OF ENGINEERS

The information-seeking behavior of engineers and scientists has been variously studied by information and social scientists, the earliest studies having been undertaken in the late 1960s (Pinelli, 1991). The results of these studies have not accumulated to form a significant body of knowledge that can be used to develop a general theory regarding the information-seeking behavior of engineers and scientists. The difficulty in applying the results of these studies has

been attributed to the lack of a unifying theory, a standardized methodology, and the common definitions (Rohde, 1986).

Despite the fact that numerous "information use" studies have been conducted, the information-seeking behavior of engineers and information use in engineering are neither broadly known nor well understood. There are a number of reasons (Berul, et al., 1965): (1) many of the studies were conducted for narrow or specific purposes in unique environments such as experimental laboratories; (2) many, if not most, of them focused on scientists exclusively or engineers working in a research environment; (3) few studies have concentrated on engineers, especially engineers working in manufacturing and production; (4) from an information use standpoint, some engineering disciplines have yet to be studied; (5) most of the studies have concentrated on the users' use of information in terms of a library and/or specific information packages such as professional journals rather than how users produce, transfer, and use information; and (6) many of the studies, as previously stated, were not methodologically sophisticated and few included testable hypotheses or valid procedures for testing the study's hypotheses.

Further, we know very little about the diffusion of knowledge in specific communities such as aerospace. In the past 25 years, few studies have been devoted to understanding the information environment in which aerospace engineers and scientists work, the information-seeking behavior of aerospace engineers and scientists, and the factors that influence the use of federally funded aerospace STI. Presumably, the results of such studies would have implications for current and future aerospace STI systems and for making decisions regarding the transfer and use of federally funded aerospace STI.

RESULTS OF THE PHASE 1 SME MAIL SURVEY

This research was conducted as a Phase 1 activity of the NASA/DoD Aerospace Knowledge Diffusion Research Project. Survey participants consisted of U.S. aerospace engineers and scientists who were on the SME mailing list of subscribers to Manufacturing Engineering (not necessarily members of the SME), and whose SIC code (i.e., 3921, 3924, and 3728) indicated they were employed in an aerospace organization. The survey instrument appears as Appendix B

The Survey

The questionnaire used in this study was jointly prepared by the project team and representatives from the Indiana University Center for Survey Research (CSR). The survey was pretested on a group of aerospace engineers and scientists across the country. The Indiana University staff prepared an envelope for each individual that contained an 11-page questionnaire, two cover letters, and self-addressed, franked reply envelope. The cover letter provided a toll-free telephone number that respondents could call if they needed additional information. The envelopes were packaged and mailed to NASA Langley Research Center (LaRC) on May 24, 1994, for mailing. The envelopes were mailed from NASA LaRC on June 1, 1994.

Between June 1, 1994 and July 5, 1994, 193 completed questionnaires were returned. Fifty-five were returned with notes attached indicating that the survey was not applicable or that the person to whom the envelope had been addressed no longer worked at that company. On July 6, 1994, a follow-up postcard was prepared for the 1,252 individuals who had not yet responded to encourage them to complete and return the questionnaire. The postcards were packaged and mailed to NASA LaRC on July 6, 1994, and mailed from NASA LaRC on July 7, 1994. Included on the postcard was a toll-free telephone number for the CSR. From July 6, 1994 through July 25, 1994, 17 questionnaires were remailed as a result of telephone requests from potential respondents.

On July 28, 1994, the CSR staff prepared a follow-up mailing for the 1,106 individuals who had not responded to the first mailing or the postcard reminder. Each envelope in the mailing contained a reminder letter, a second copy of the questionnaire, and a self-addressed, franked reply envelope. The envelopes were prepared, packaged, and shipped to NASA LaRC on July 28, 1994.

By October 21, 1994, the survey cut-off date, 465 completed questionnaires had been received at the Indiana University CRS. The adjusted completion rate for the survey was 41%.

Data Collection and Analysis

A variation of Flanagan's (1954) critical incident technique was used to guide data collection. According to Lancaster (1978), the theory behind the critical incident technique is that it is much easier for people to recall accurately what they did on a specific occurrence or occasion than it is to remember what they do in general. Respondents were asked to categorize the most important job-related projects, task, or problem they had worked on in the past 6 months. The categories included (1) research, (2) design, (3) development, (4) manufacturing, (5) production, (6) quality assurance/control, (7) computer applications, (8) management, and (9) other.

Respondents were also asked to rate the amount of technical uncertainty and complexity they faced when they started their most important project, task, or problem. Technical uncertainty and complexity were measured on 5-point scales (1.0 = little uncertainty; 5.0 = great uncertainty; 1.0 = little complexity, 5.0 = great complexity). Survey participants were also asked to indicate whether they worked alone or with others in completing/solving the most important job-related project, task, or problem they had worked on in the past 6 months.

Technical uncertainty, complexity, and the importance of federally funded aerospace R&D were measured using ordinal scales. Hours spent communicating and the number of journal articles, conference-meeting papers, and U.S. government technical reports used were measured on an interval scale. Use of formal information sources and federally funded aerospace R&D were measured using a nominal scale. Data analysis was based on 465 responses, the total number of respondents received by the established cut-off date.

DESCRIPTIVE FINDINGS

Survey demographics for the 465 respondents appear in table 1. The following "composite" participant profile was developed for the respondents: works in industry (100%), has a bachelor's degree (45.9%), has an average of 16.5 years of work experience in aerospace, was educated as and works as an engineer (73.3%, 71.3%), works in manufacturing and production (51.0%), and is male (96.3%).

Project, Task, Problem

Survey participants were asked to categorize the most important job-related project, task, or problem they had worked on in the past 6 months. The categories and responses are listed in table 2. A majority of the job-related projects, tasks, and problems (47.1%) were categorized as manufacturing/production. About 12.5% and 9.9% of the job-related projects, tasks, and problems were categorized as development and management, respectively. Most respondents (73.4%) worked with others (did not work alone) in completing their most important job-related project, task, or problem.

Number of Groups and Group Size. On average, respondents worked with 3.0 groups; each group contained an average of 5.5 members (table 2). A majority of respondents (61.3%) performed engineering duties while working on their most important job-related project, task, or problem. About 26% performed management duties.

<u>Project, Task, Problem Complexity and Uncertainty.</u> Respondents were asked to rate the overall complexity of their most important job-related project, task, or problem. The mean complexity score was 3.85 (of a possible 5.00). Respondents were also asked to rate the amount of technical uncertainty they faced when they started their most important project, task, or problem. The average (mean) technical uncertainty score was 3.21 (of a possible 5.00).

Correlation coefficients (Pearson's r) were calculated to compare (1) the overall "level of project, task, or problem complexity" and "technical uncertainty" and (2) the level of "project, task, or problem complexity by category" and "technical uncertainty." The correlation coefficients appear in table 3. Positive and significant correlations were found for both comparisons. These findings support the hypothesis that there is a (positive) relationship between technical uncertainty and complexity.

<u>Project, Task, or Problem and Information Use</u>. Respondents were given a list of the following information sources used to complete their most important job-related project, task, or problem: (1) used personal stores of technical information, (2) spoke with coworkers inside the organization, (3) spoke with colleagues outside of the organization, (4) spoke with a librarian/technical information specialist, (5) used literature resources in the organization's library (6) searched (or had someone search for me) an electronic (bibliographic) data base. They were

Use of Federally Funded Aerospace R&D. About 31.4% (412) of the participants used the results of federally funded aerospace R&D in their work. Respondents who used federally funded aerospace R&D in their work were given a list of 12 sources. They were asked to indicate how often they had learned about the results of federally funded aerospace R&D from each of the 12 sources. A 4-point scale (4.0 = frequently; 1.0 = never) was used to measure frequency. In table 5, the "frequently" and "sometimes" responses were combined to determine the overall use of the 12 sources. Of the six most frequently used sources, half involve interpersonal communication and half are formal (written) communication. Four of the five "federal initiatives" were the sources used least to learn about the results of federally funded aerospace R&D. NASA and DoD technical reports were the exception.

The respondents who reported using the results of federally funded aerospace R&D were asked if they used these results in completing the most important job-related project, task, or problem they had worked on in the past 6 months. The 18.6% (85) of respondents who answered "yes" were asked about the importance of these results in completing the project, task, or problem. A 5-point scale (1.0 = very unimportant, 5.0 = very important) was used to measure importance. The mean importance rating was 3.7. Almost one-half of those who used federally funded R&D (51 respondents) responded with an importance rating of "4" or "5". About 57% (46) of those who used the results of federally funded aerospace R&D in completing their most important job-related project, task, or problem indicated that the results were published in either a NASA or DoD technical report.

12. Librarians Inside My Organization	39.7	29

The respondents who used the results of federally funded aerospace R&D in completing their most important job-related project, task, or problem were asked which problems, if any, they encountered in using these results (see table 6). Respondents were given a list of six problems from which to choose. About 46% indicated that the "time and effort it took to locate the results" was a problem. About 46% reported that the "time and effort it took to physically obtain the results" was a problem. About 36% indicated that "accuracy, precision, and reliability of the results" was a problem, and about 24% reported that "distribution limitations or security restrictions" constituted a problem. About 24/21% indicated that "organization or format"/"legibility or readability" of the results constituted a problem.

Technical Communications Practices

Data which describe factors concerning the production and use of technical information are summarized in table 7. Participants were asked to indicate the importance of communicating technical information effectively (e.g., producing written materials or oral discussions). A 5-point scale was used to measure importance (1.0 = very unimportant; 5.0 = very important).

Importance and Time Spent. The mean importance rating was 4.5; approximately 89% of respondents indicated that it was important to communicate technical information effectively. Respondents were also asked to report the total number of hours per week they had spent communicating technical information, both in written form and orally, during the past 6 months. Respondents reported spending slightly more time on producing oral discussions (an average of

Table 6. Problems Related to Use of Federally-Funded Aerospace R&D

Problem	Percentage	Number
Time And Effort To Locate Results	45.7	42
Time And Effort To Obtain Results	45.7	42
Accuracy, Precision And Reliability		
Of Results	35.9	33
Distribution Limitations Or Security		
Restrictions Of Results	23.9	22
Organization Or Format Of Results	23.9	22
Legibility Or Readability Of Results	20.7	19

12.6 hours/week) than written materials (an average of 10.5 hours/week). Approximately 67% of the respondents indicated that the amount of time they spent communicating technical information to others had increased over the past 5 years. About 5% indicated a decrease in the amount of time spent communicating technical information to others over the same period.

Respondents were also asked to report the total number of hours per week spent working with technical information, both written and oral, received from others in the past 6 months (see table 7). Respondents reported spending slightly more time working with written technical information received from others (an average of 10.4 hours/week) than with technical information received orally from others (an average of 8.2 hours/week). Approximately 68% of the respondents indicated that, as they have advanced professionally, the amount of time spent working with technical information received from others had increased. About 8% indicated a decrease in the amount of time they spent working with technical information when compared with 5 years ago.

Collaborative Writing. An attempt was made to determine the amount of writing in U. S. aerospace that is collaborative. Survey participants were asked to indicate the percentage of their written technical communications in the past 6 months that involved writing alone, with one other person, with a group of two to five people, and with a group of more than five people. About 40% of the survey respondents indicated that about 100% of the written technical communications they prepared involved writing alone. [The mean percent was $(\bar{X} = 76.0)$ and the median percent was 90.0.] About 83% indicated that their written technical communications involved writing with one other person. [The mean percent was $(\bar{X} = 18.8)$ and the median percent was 15.0.] About 66% indicated that their written technical communications involved writing with a group of two to five people. [The mean percent was $(\bar{X} = 14.0)$ and the median percent was 6.0.] About 29% indicated that their written technical communications involved writing with a group of more than five people. [The mean percent was $(\bar{X} = 4.1)$ and the median percent was 0.0.]

Table 7. Technical Communications: Importance, Time Spent, and Change Over Time

Communication And Receipt Of Information	Percentage	Number
Importance Of Communicating Technical Information:		
Unimportant	4.5	21
Neither important Nor Unimportant	6.0	28

With Technical Information Received From Others:	(0.2	
Increased	68.3	314
Stayed The Same	23.5	108
Decreased	8.3	38

Survey participants who write collaboratively were asked if they find writing as part of a group more or less productive (i.e., producing more written products or producing better written products) than writing alone. The responses appear in table 8. Overall, slightly more of the respondents indicated that writing with a group is more productive than writing alone. About 42% indicated that a group is more productive and about 37% indicated that a group is less productive. About 21% indicated that a group is about as productive as writing alone.

Table 8. Influence of Group Participation on Writing Productivity

How Productive	Percentage	Number
A Group Is More Productive Than Writing Alone A Group Is About As Productive As Writing Alone A Group Is Less Productive Than Writing Alone	42.2 20.6 37.2	142 64 129

Survey participants were asked if, during that 6 month period, they had worked with the same group of people when producing written technical communications. About 60% (161 respondents) indicated "yes" they had worked with the same group, and about 34% indicated that they had worked with various groups. Of those who indicated that they had worked in the same group, these respondents were asked how many people were in the group. About 74% (118 respondents) indicated a group size of 2-5 people and about 13% (21 respondents) indicated a group size of 6-10 people. The mean number of people in the group was $\bar{X} = 4.6$ and the median was 3.0.

Those 106 respondents who indicated "no" meaning that they did not work with the same group during the past 6 months were asked with about how many groups they had worked. About 25% (25 respondents) reported working with 2 groups, about 32% (32 respondents) reported working with 3 groups, about 17% (17 respondents) reported working with 4 groups, about 7% (7 respondents) reported working with 5 groups, and about 9% (9 respondents) reported working with 6-10 groups. The average (mean) number of groups was $\bar{X} = 3.6$ and the median number of groups was 3.0. The number of people in each group varied. About 75% of the respondents reported working with a group of 2-5 people and about 21% reported working with a group of 6-10 people. The average (mean) number of people per group was $\bar{X} = 4.5$ and the median number of people per group was 4.0.

<u>Technical Information Products Produced</u>. Survey participants were given a list of technical information products. They were asked to indicate the number of these products they had written or otherwise prepared in the past 6 months and if those products had been written or prepared as part of a group. The 10 most frequently produced (alone) technical information products appear in table 9.

Survey participants were also asked to indicate the number of these products they had written or otherwise prepared in the past 6 months as part of a group. The 10 most frequently prepared (as part of a group) technical information products appear in table 10. Data shown in table 10

include the number of products produced (mean and median) and the average (mean and median) numbers of people per group.

Table 9. Technical Information Products Written or Produced Alone in the Past 6 Months

Products	Mean (\overline{X})	Median
Memoranda	21.5	12.0
Letters	16.9	10.0
Drawings/Specifications	21.7	10.0
DoD Technical Reports	1.9	0.0
Audio/Visual Materials	7.9	4.0
In-house Technical Reports	8.8	3.0
Computer Program Documentation	10.7	2.0
Conference/Meeting Papers	6.8	2.0
Technical Talks/Presentations	6.2	3.0
Technical Proposals	7.6	3.0

A comparison of the data contained in tables 9 and 10 reveals more similarities than differences. The production numbers vary somewhat but the products included on both lists (products produced alone or as part of a group) are essentially identical. With the exception of the "group size" for technical proposals, the average numbers of people per group for the various products produced are fairly similar in size.

Survey participants were given a list of technical information products. They were asked to indicate approximately how many times in the past 6 months they had used each of them. The 10 most frequently used technical information products appear in table 11. A comparison of the data contained in tables 9 (production) and 11 (use) reveals two differences. First, on average, more products are used than are produced. Second, there are slight differences in the types or kinds of products produced and used.

Technical Information Products -- Use, Importance, and Frequency of Use

Survey participants were asked several questions designed to obtain a greater understanding of the factors affecting the use of technical reports. In this study, technical reports were placed within the context of two technical information products: conference/meeting papers and journal articles. DoD, in-house, and NASA technical reports were included in this study.

<u>Use</u>. Survey participants were asked if they used the aforementioned technical information products in performing their present professional duties. Table 12 includes data regarding use.

Table 10. Technical Information Products Written or Produced as Part of a Group in the Past 6 Months

	In a C	In a Group		Average Number of People Per Group	
Information Products	Mean (X)	Median	Mean (X)	Median	
Drawings/Specifications	12.6	4.0	3.9	3.0	
Letters	7.2	2.0	3.6	2.0

Technical Manuals	3.9	1.0	4.8	4.0	
Technical Proposals	7.2	3.0	4.6	4.0	

Table 11. Technical Information Product Used in the Past 6 Months

Information Products	Mean (\overline{X})	Median
Drawings/Specifications	80.2	25.0
Memoranda	32.4	15.0
Letters	21.3	10.0
Trade/Promotional Literature	17.3	6.0
Technical Manuals	20.3	6.0
Abstracts	3.9	2.0
Audio/Visual Materials	16.4	5.0
Computer Program Documentation	21.0	6.0
Technical Proposals	8.1	3.0
Technical Talks/Presentations	6.7	4.0

Table 12. Technical Information Products Used

Information Products	Percentage	Number
Conference/Meeting Papers	62.7	271
Journal Articles	72.0	122
In-house Technical Reports	83.3	369
DoD Technical Reports	34.6	143
NASA Technical Reports	22.7	92

Importance. Survey participants were asked "how important is it for you to use the aforementioned technical information products in performing your present professional duties?" Table 13 includes data regarding the importance of use technical information products. A 5-point scale (1.0 = very unimportant; 5.0 = very important) was used to measure importance.

Table 13. Importance of Technical Information Products

Information Products	Mean (X) Importance	Number	
Conference/Meeting Papers	2.9	443	
Journal Articles	3.0	444	
In-house Technical Reports	3.7	451	
DoD Technical reports	2.3	427	
NASA Technical reports	2.1	416	

Approximately 37% (163 respondents) indicated that the use of conference/meeting papers was "very or somewhat" important to their work. Approximately 36% (160 respondents) indicated that the use of journal articles was "very or somewhat" important to their work. Approximately 64% (290 respondents) indicated that in-house technical reports were "very or somewhat" important to their work. Approximately 22% (92 respondents) and 13% (56 respondents), respectively, indicated that DoD and NASA technical reports were "very or somewhat" important to their work.

<u>Frequency of Use</u>. Survey participants were asked to indicate the number of times each of the five technical information products had been used in a 6 month period in the performance of their professional duties (table 14). Data are presented both as means and medians. In-house

Table 14. Average Number of Times (Median) Technical Information Products
Used in a 6 Month Period

Information Products	Mean (X) Use	Median
Conference/Meeting Papers	8.51	3.00
Journal Articles	7.40	5.00
In-house Technical Reports	12.56	5.00
DoD Technical Reports	4.47	0.00
NASA Technical Reports	1.89	0.00

technical reports were used ($\overline{X} = 12.56$) to a much greater extent than were the other technical information products. Conference/meeting papers were used to a lesser extent ($\overline{X} = 8.51$) followed by journal articles ($\overline{X} = 7.40$), DoD ($\overline{X} = 4.47$), and NASA technical reports ($\overline{X} = 1.89$).

Technical Information Products -- Factors Affecting Use

Even if they did not use them, survey participants were asked if they were deciding whether or not to use any of the five technical information products in performing their present professional duties, how important each of the eight characteristics (factors) would be in making that decision. For example, respondents were asked to indicate how important the factor, "they are easy to physically obtain," would be in making a decision to use conference/meeting papers. A 5-point scale (1.0 = very unimportant; 5.0 = very important) was used to measure importance. The higher the number, the greater the influence of the factor on the use of conference/meeting papers. An overall mean (\overline{X}) rating was calculated. A mean (\overline{X}) rating for users and non-users of each product is presented.

<u>Conference/Meeting Papers</u>. The importance factor ratings for conference/meeting papers appear in table 15. The factors exerting the greatest influence on use were (1) relevant to my work $(\overline{X} = 4.5)$, (2) good technical quality $(\overline{X} = 4.3)$, (3) comprehensive data and information $(\overline{X} = 4.3)$, (4) easy to use or read $(\overline{X} = 4.1)$, and (5) easy to physically obtain $(\overline{X} = 3.9)$.

Table 15. Factors Affecting the Use of Conference/Meeting Papers

	User Rating (X̄)	Non-User Rating (X)	Overall Rating (\overline{X})
Factors	n = 268	n = 154	n = 422
Are Easy To Physically Obtain	4.0	3.9	3.9
Are Easy To Use Or Read	4.1	4.0	4.1
Are Inexpensive	3.5	3.7	3.6
Have Good Technical Quality	4.5	4.2	4.3
Have Comprehensive Data And Information	4.5	4.1	4.3
Are Relevant To My Work	4.6	4.5	4.5
Can Be Obtained At A Nearby Location Or Source	3.7	3.8	3.7
Had Good Prior Experiences Using Them	3.5	3.4	3.4

<u>Journal Articles</u>. The importance factor ratings for journal articles appear in table 16. The factors exerting the greatest influence on use were (1) relevant to my work ($\overline{X} = 4.4$), (2) good technical quality ($\overline{X} = 4.3$), (3) comprehensive data and information ($\overline{X} = 4.3$), (4) easy to use or read ($\overline{X} = 4.1$), and (5) easy to physically obtain ($\overline{X} = 3.9$).

Table 16. Factors Affecting the Use of Journal Articles

	User Rating (\vec{X})	Non-User Rating (\overline{X})	Overall Rating (X)
Factors	n = 310	n = 114	n = 424
Are Easy To Physically Obtain	4.0	3.7	3.9
Are Easy To Use Or Read	4.1	4.0	4.1
Are Inexpensive	3.6	3.4	3.6
Have Good Technical Quality	4.4	4.1	4.3
Have Comprehensive Data And Information	4.4	4.1	4.3
Are Relevant To My Work	4.5	4.2	4.4
Can Be Obtained At A Nearby Location Or Source	3.7	3.5	3.6
Had Good Prior Experiences Using Them	3.4	3.3	3.4

<u>In-House Technical Reports.</u> The importance factor ratings for in-house technical reports appear in table 17. The factors exerting the greatest influence on use were (1) relevant to my work $(\overline{X} = 4.5)$, (2) good technical quality $(\overline{X} = 4.4)$, (3) comprehensive data and information $(\overline{X} = 4.4)$, (4) easy to use or read $(\overline{X} = 4.2)$, and (5) easy to physically obtain $(\overline{X} = 4.0)$.

<u>DoD Technical Reports.</u> The importance factor ratings for DoD technical reports appear in table 18. The factors exerting the greatest influence on use were (1) relevant to my work ($\overline{X} = 4.3$), (2) good technical quality ($\overline{X} = 4.2$), (3) comprehensive data and information ($\overline{X} = 4.2$), (4) easy to use or read ($\overline{X} = 4.0$), and (5) easy to physically obtain ($\overline{X} = 3.9$).

Table 17. Factors Affecting the Use of In-house Technical Reports

	User Rating (X)	Non-User Rating (\overline{X})	Overall Rating (\overline{X})

Can Be Obtained At A Nearby Location Or Source	3.6	3.5	3.5
Had Good Prior Experiences Using Them	3.5	3.3	3.3

Use and Importance of Computer and Information Technology

Survey participants were asked if they use computer technology to prepare (written) technical communications. Almost all (95.3%) (443) of the survey respondents use computer technology to prepare (written) technical information. About 39.6% (184) of the respondents "always" use computer technology to prepare (written) technical information. About 98% (456) indicated that computer technology had increased their ability to communicate technical information. About 76% (353) of the respondents stated that computer technology had increased their ability to communicate technical information "a lot".

From a prepared list, survey respondents were asked to indicate which computer software they used to prepare written technical communication (table 20). Word processing software was used most frequently by survey respondents, followed by spelling checkers, business graphics, grammar and style checkers, and a thesaurus. Outliners and prompters and desktop publishing computer software were "least frequently" used to prepare written technical communication.

Table 20. Use of Computer Software to Prepare Written Technical Communication

Software	Percentage	Number
Word Processing	96.1	415
Outliners And Prompters	24.7	68
Grammar And Style Checkers	64.1	216
Spelling Checkers	88.1	353
Thesaurus	61.2	200
Business Graphics	69.3	232
Scientific Graphics	60.4	198
Desktop Publishing	46.3	145

Survey respondents were also given a list of information technologies and asked, "How do you view your use of the following information technologies in communicating technical information?" Their choices included "already use it"; "don't use it, but may in the future"; and "don't use it and doubt if I will". (See table 21.) The aerospace engineers and scientists in this study use a variety of information technologies. The percentages of "I already use it" responses ranged from a high of 95% (FAX and TELEX) to a low of 11% (motion picture films).

A list, in descending order, follows of the information technologies most frequently used.

FAX or TELEX	95%
Electronic Data Bases	70
Electronic Mail	62
Electronic Networks	63
Videotape	58

A list, in descending order, follows of the information technologies "that are not currently being used but may be used in the future."

Laser Disk/Video Disk/CD-ROM	56%

Laser Disk/Video Disk/CD-ROM	27.4	113	56.3	232	16.3	67
Electronic Networks	62.8	268	29.5	126	7.7	33

Use and Importance of Electronic Networks

Survey participants were asked if the use electronic networks in their workplace in performing their present duties. About 73.9% of the respondents use electronic networks in performing their present duties and about 26.2% either do not use (14.4%), or do not have access to (11.8%) electronic networks. Survey respondents used electronic networks an average of 14.3 hours per week. (See table 22.)

Table 22. Use of Electronic Networks in One Week

Use		Percentage	Number
0 Hours		2.1	7
10 Hours		53.3	180
11 - 25 Hours		24.7	83
26 - 50 Hours		19.1	64
51 Or More Hours		0.9	3
Mean	14.3		
Median	10.0		

Respondents who use them were also asked to rate the importance of electronic networks in performing their present duties (table 23). Importance was measured on a 5-point scale with 1 = not at all important and 5 = very important. About 80% of the respondents rated electronic networks important. About 14% rated them neither important nor unimportant, and about 7% rated electronic networks as very unimportant.

Table 23. Importance of Electronic Networks

Importance	Percentage	Number
Very Important Neither Important Nor Unimportant Very Unimportant	79.6 13.6 6.8	270 46 23

Respondents were asked how they accessed electronic networks (table 24): mainframe terminal, personal computers, and workstations. Access via personal computer (72%) was most frequently reported. Access via mainframe terminal and workstation was reported by less than 50% of the survey respondents.

THE TECHNICAL COMMUNICATIONS PRACTICES OF U.S. AEROSPACE ENGINEERS AND SCIENTISTS: RESULTS OF THE PHASE 1 SME MAIL SURVEY

Thomas E. Pinelli, Rebecca O. Barclay, and John M. Kennedy

ABSTRACT

The U.S. government technical report is a primary means by which the results of federally funded research and development (R&D) are transferred to the U.S. aerospace industry. However, little is known about this information product in terms of its actual use, importance, and value in the transfer of federally funded R&D. Little is also known about the intermediary-based system that is used to transfer the results of federally funded R&D to the U.S. aerospace industry. To help establish a body of knowledge, the U.S. government technical report is being investigated as part of the NASA/DoD Aerospace Knowledge Diffusion Research Project. In this report, we summarize the literature on technical reports, present a model that depicts the transfer of federally funded aerospace R&D via the U.S. government technical report, and present the results of research that investigated aerospace knowledge diffusion vis-à-vis the technical communication practices of U.S. aerospace engineers and scientists affiliated with, not necessarily members of, the Society of Manufacturing Engineers (SME).

INTRODUCTION

NASA and the DoD maintain scientific and technical information (STI) systems for acquiring, processing, announcing, publishing, and transferring the results of government-performed and government-sponsored research. Within both the NASA and DoD STI systems, the U.S. government technical report is considered a primary mechanism for transferring the results of this research to the U.S. aerospace community. However, McClure (1988) concludes that we actually know little about the role, importance, and impact of the technical report in the transfer of federally funded R&D because little empirical information about this product is available.

We are examining the system(s) used to diffuse the results of federally funded aerospace R&D as part of the NASA/DoD Aerospace Knowledge Diffusion Research Project. This project investigates, among other things, the information-seeking behavior of U.S. aerospace engineers and scientists, the factors that influence the use of STI, and the role played by U.S. government technical reports in the diffusion of federally funded aerospace STI (Pinelli, Kennedy, and Barclay, 1991; Pinelli, Kennedy, Barclay, and White, 1991). The results of this investigation could (1) advance the development of practical theory, (2) contribute to the design and development of aerospace information systems, and (3) have practical implications for transferring the results of federally funded aerospace R&D to the U.S. aerospace community. The project fact sheet is Appendix A.

In this report, we summarize the literature on technical reports, provide a model that depicts the transfer of federally funded aerospace R&D through the U.S. government technical report, and present the results of the Phase 1 SME mail survey. We summarize the findings of the Phase 1 mail survey in terms of the technical communication practices of U.S. aerospace engineers and scientists affiliated with, not necessarily members of, the Society of Manufacturing Engineers (SME).

THE U.S. GOVERNMENT TECHNICAL REPORT

Although they have the potential for increasing technological innovation, productivity, and economic competitiveness, U.S. government technical reports may not be utilized because of limitations in the existing transfer mechanism. According to Ballard, et al., (1986), the current system "virtually guarantees that much of the Federal investment in creating STI will not be paid back in terms of tangible products and innovations." They further state that "a more active and coordinated role in STI transfer is needed at the Federal level if technical reports are to be better utilized."

Characteristics of Technical Reports

The definition of the technical report varies because the report serves different roles in communication within and between organizations. The technical report has been defined etymologically, according to report content and method (U.S. Department of Defense, 1964); behaviorally, according to the influence on the reader (Ronco, et al., 1964); and rhetorically, according to the function of the report within a system for communicating STI (Mathes and Stevenson, 1976). The boundaries of technical report literature are difficult to establish because of wide variations in the content, purpose, and audience being addressed. The nature of the report -- whether it is informative, analytical, or assertive -- contributes to the difficulty.

Fry (1953) points out that technical reports are heterogenous, appearing in many shapes, sizes, layouts, and bindings. According to Smith (1981), "Their formats vary; they might be brief (two pages) or lengthy (500 pages). They appear as microfiche, computer printouts or vugraphs, and often they are loose leaf (with periodic changes that need to be inserted) or have a paper cover, and often contain foldouts. They slump on the shelf, their staples or prong fasteners snag other documents on the shelf, and they are not neat."

Technical reports may exhibit some or all of the following characteristics (Gibb and Phillips, 1979; Subramanyam, 1981):

- Publication is not through the publishing trade.
- Readership/audience is usually limited.
- Distribution may be limited or restricted.

Table 24. How Electronic Networks are Accessed

Access	%	(n)
Mainframe Terminal Personal Computer Workstation	47.8 72.2 42.6	165 249 147

Respondents using them were asked to indicate the purpose(s) for which they used electronic networks (table 25). Survey respondents indicated that information search and retrieval (79.6%) electronic mail (74.5%), log on to remote computers (59.5%), connect to geographically distant sites (53.1%), and accessing/searching the library's catalog (52.0%) represented their greatest use of electronic networks. Also noticeable is the lack of electronic network use for controlling remote equipment, acquiring (ordering) documents from the library, and searching (bibliographic) data bases.

Table 25. Use of Electronic Networks for Specific Purposes

Purpose	Percentage	Number
Connect To Geographically Distant Sites	53.1	165
Electronic Mail	74.5	243
Electronic Bulletin Boards Or Conferences	42.4	129
Log On To Remote Computers	59.5	188
Control Remote Equipment	34.1	103
Access/Search The Library's Catalog	52.5	165
Order Documents From The Library	36.2	110
Search Electronic (Bibliographic) Data Bases	39.3	119
Information Search And Data Retrieval	79.6	257
Prepare Scientific And Papers With		
Colleagues At Geographically Distant Sites	20.1	61

Survey participants who used electronic networks were asked to identify the groups with whom they exchanged messages or files (table 26). About three-quarters of the survey respondents used electronic networks to exchange files with members of their own work group, others in their organization but not in their work group, and people outside their organization.

Table 26. Use of Electronic Networks to Exchange Messages or Files

Exchange With	Percentage	Number
Members Of Own Work Group Others In Your Organization But Not	78.4	257
In Your Work Group	75.2	248
Others In Your Organization, Not In Your Work Group, At A Geographically		
Different Site	52.8	169
People Outside Your Work Group	71.0	233

Use and Importance of Libraries/Technical Information Centers

Almost all of the survey respondents indicated that their organization has a library/technical information center. About 47% of the survey respondents indicated that the library/technical information center was located in the building where they worked. About 37% of the respondents indicated that the library/technical information center was located outside the building in which they worked. Sixteen percent of the respondents reported that their organization did not have a library/technical information center.

For 33% of the respondents, the library/technical information center was located 1 mile or less from where they worked. For about 67% of the respondents, the library/technical information center was located more than one mile from where they worked.

Survey respondents were also asked if the proximity of their work setting (e.g., office to their organization's library/technical information center) affected their use of that facility (table 27). The importance of proximity was measured on a 5-point scale with 1 = unimportant and 5 = very important. About 39% of the respondents indicated that proximity was "not at all" important. About 29% indicated that proximity was neither important nor unimportant. Thirty-two percent of the respondents indicated that proximity was very important. Overall, survey respondents were about equally divided on the extent to which proximity of the work setting to the library/technical information center influence its use.

Respondents were also asked to rate the importance of the organization's library/technical information center in terms of performing their professional duties. Importance was measured on a 5-point scale with 1 = not at all important and 5 = very important (see table 28). About 56% of the aerospace engineers and scientists in the study indicated that their organization's library/technical information center was important or very important in performing their present professional duties. Approximately 24% of the survey respondents indicated that their library was neither important nor unimportant to performing their present professional duties. About 20% of respondents indicated that their organization's library/technical information center was very unimportant to performing their present professional duties.

Table 27. The Influence of Proximity of the Organization's Library/Technical Information Center on Use

Proximity		Percentage	Number
Not At All Important Neither Important Very Important	rtant t Nor Unimportant	39.4 28.6 32.0	117 85 95
Mean Median	2.8 3.0		

Table 28. Importance of the Organization's Library/Technical Information Center on Use

Importance	Percentage	Number
Not At All Important	55.9	166
Neither Important Nor Unimportant	23.9	71
Very Important	20.2	60

Survey respondents were asked to report the number of times they had used their organization's library/technical information center in the past 6 months (see table 29). On average, survey respondents used their library/technical information center about 12 times in the past 6 months. About 24% of the survey respondents did not use their library's library/technical information center in the past 6 months. Reasons for not using the organization's library/technical information center are shown in table 30. About 87% of the respondents were more easily met some other way. About 42% indicated that they had no information needs. About 34% indicated that the library did not have the information they needed.

Table 29. Use of the Organization's Library/Technical Information Center in the Past 6 Months

Visits		Percentage	Number
0 Times		23.8	91
1 - 5 Times		34.4	132
6 - 10 Times		13.3	51
11 - 25 Times		17.3	66
26 - 50 Times		7.4	28
51 - 94 Times		0.6	2
95 Or More Times		3.4	13
Mean	11.8		
Median	4.0		

Table 30. Reasons Respondents Did Not Use A Library During the Past 6 Months

Reason	Percentage	Number
I Had No Information Needs	41.8	82
My Information Needs Were More Easily Met		
Some Other Way	86.6	175
Tried The Library Once Or Twice Before But I		
Couldn't Find The Information I Needed	11.0	20
The Library Staff Is Not Cooperative Or Helpful	3.8	7
The Library Staff Does Not Understand My		
Information Needs	7.6	14
The Library Did Not Have The Information I Need	33.9	63
I Have My Own Personal Library And Do Not		
Need Another Library	26.9	50
The Library Is Too Slow In Getting The		
Information I Need	15.3	28
We Have To Pay To Use The Library	1.1	2
We Are Discouraged From Using The Library	1.1	2

FINDINGS

Readers should note that the data contained in this report reflect the responses of U.S. aerospace engineers and scientists who were on the Society of Manufacturing Engineers (SME) mailing list (not necessarily members of the SME). The results, therefore, are not generalizable to (1) the membership of the SME, (2) all U.S. aerospace engineers and scientists working in manufacturing/production, or (3) all U.S. aerospace engineers and scientists. Further, the survey was conducted during the time when the U.S. aerospace industry was undergoing significant changes. Many organizations had merged or had gone out of business. Many members of the sample had left their jobs.

- 1. The "average" participant works in industry (100%), has a bachelor's degree (46.7%), has an average of 16.5 years of work experience in aerospace, was educated as and works as an engineer (73%, 71%), and works in manufacturing/production (51%), and is male (96%).
- 2. Their most important job-related project, task, or problem worked on in the past 6 months was categorized as manufacturing/production (47%); 73% of the participants worked on this project, task, or problem with others. The mean number of groups involved was 3.0, and the mean number of people in a work group was 5.5. Engineering duties predominated (61%) followed by management duties (26%) in the completion of the most important job-related project, task, or problem worked on in the past 6 months.

- 3. A positive and significant correlation was found between the overall complexity and technical uncertainty of the most important job-related project, task, or problem that respondents had worked on in the past 6 months.
- 4. To complete their most important job-related project, task, or problem, respondents first went to their personal stores of technical information (54%); next, spoke with coworker(s) inside the organization (47%); third, spoke with colleagues outside of the organization (37%); fourth, and fifth, used literature resources in the organization's library (20%); and sixth, spoke with a librarian/technical information specialist (6%). About 64% and 61%, respectively, did not speak to a librarian or search (or have searched) electronic data bases to complete their most important job-related project, task, or problem.
- 5. Approximately 31% of the respondents reported using the results of federally funded aerospace R&D in their work. Of the six sources most frequently used to find out about the results of federally funded aerospace R&D, half involve interpersonal communication and half are formal (written) communication. Four of five "federal initiatives" were the sources used least to learn about the results of federally funded aerospace R&D. DoD and NASA technical reports were the exception.
- 6. About 19% of the respondents had used the results of federally funded aerospace R&D to complete their most important job-related project, task, or problem during the last 6 months. About 50% of this group indicated that federally funded aerospace R&D was "important" or "very important" for completing this work. About 57% (46) of those who used the results of federally funded aerospace R&D in completing their most important job-related project, task, or problem indicated that the results were published in either a NASA or DoD technical report.
- 7. Of the respondents who used the results of federally funded aerospace R&D in completing their most important job-related project, task, or problem, 46% indicated that the "time and effort it took to locate the results" was a problem, and 46% reported that the "time and effort it took to obtain the results" was a problem.
- 8. About 90% of the respondents indicated that it was important to communicate technical information effectively; respondents spent an average of 10.5 hours per week producing written material and 12.6 hours per week communicating information orally. Over the past 5 years approximately 67% have increased the amount of time they spend communicating information to others. Survey respondents reported spending an average of 10.4 hours per week working with written information received from others and an average of 8.2 hours per week working with information received orally from others. More than 68% of the respondents indicated that the amount of time they spend working with technical information received from others has increased as they have advanced professionally.
- 9. About 40% of the respondents reported that all of the written technical communications they prepared involved writing alone. About 83% indicated that their written technical communications involved writing with one other person. About 66% indicated that their written technical

communications involved writing with a group of two to five people. About 29% indicated that their written technical communications involved writing with a group of more than five people.

- 10. In terms of the perceived productivity of collaborative writing, slightly more of the respondents indicated that writing with a group is more productive than writing alone. About 42% indicated that a group is more productive and about 37% indicated that a group is less productive. About 21% indicated that a group is about as productive as writing alone.
- 11. A comparison of the technical information products produced and used reveals that on average, the survey respondents use more products than they produce. There are also slight differences in the types of technical information products produced and used.
- 12. Survey respondents were asked to indicate their use of and the importance to them of five technical information products. In-house technical reports were used most frequently ($\bar{X} = 12.6$) and were rated most important ($\bar{X} = 3.7$). DoD and NASA technical reports were used by about 35% and 25% of the respondents and were rated about equal in importance ($\bar{X} = 2.3$, $\bar{X} = 2.1$).
- 13. Both users and non-users of the five information products were asked to indicate about the importance of eight factors in deciding whether to use any of the five information products. Overall, the factors exerting the greatest influence on decisions to use products follow.

Conference/meeting papers -- (1) good technical quality, (2) relevant to my work, (3) comprehensive data and information, (4) easy to use or read, and (5) easy to physically obtain.

Journal articles -- (1) relevant to my work, (2) good technical quality, (3) comprehensive data and information, (4) easy to use or read, and (5) easy to physically obtain.

In-house technical reports -- (1) relevant to my work, (2) good technical quality, (3) comprehensive data and information, (4) easy to use or read, and (5) easy to physically obtain.

DoD technical reports -- (1) relevant to my work, (2) good technical quality, (3) comprehensive data and information, (4) easy to use or read, and (5) easy to physically obtain.

NASA technical reports -- (1) relevant to my work, (2) good technical quality, (3) comprehensive data and information, (4) easy to use or read, and (5) easy to physically obtain.

- 14. About 95% of the survey participants used computer technology to prepare written technical communications; about 98% of them indicated that computer technology had increase their ability to communicate technical information.
- 15. Word processing and spelling checkers were the computer software used most often in preparing written technical information.

- 16. FAX or TELEX, electronic data bases, electronic mail, electronic networks, and videotape were the information technologies used most frequently by survey respondents.
- 17. About 74% of the survey participants used electronic networks in performing their present professional duties; they use electronic networks an average of 14.3 hours per week; and about 80% rated them important in terms of performing their present professional duties.
- 18. About 70% of the respondents access electronic networks via personal computer; about 75% use electronic networks for electronic mail and to search and retrieve information and data; and about 78% use electronic networks to exchange messages and files with members of their own group.
- 19. Survey respondents (56%) indicated that the organization's library/technical information center was important in performing their present professional duties.
- 20. On average, survey respondents visited their organization's library/technical information center 11.8 times in a 6 month period; survey respondents were about equally divided as to whether proximity of the work setting to the organization's library/technical information center influenced its use.
- 21. The most common reasons for not using the organization's library/technical information center included "my information needs were more easily met some other way," "I had no information needs," and "the library did not have the information I needed."

APPENDIX A: PROJECT FACT SHEET

NASA/DoD AEROSPACE KNOWLEDGE DIFFUSION RESEARCH PROJECT

Fact Sheet

The process of producing, transferring, and using scientific and technical information (STI), which is an essential part of aerospace research and development (R&D), can be defined as Aerospace Knowledge Diffusion. Studies tell us that timely access to STI can increase productivity and innovation and help aerospace engineers and scientists maintain and improve their professional skills. These same studies indicate, however, that we know little about aerospace knowledge diffusion or about how aerospace engineers and scientists find and use STI. To learn more about this process, we have organized a research project to study knowledge diffusion. Sponsored by NASA and the Department of Defense (DoD), the NASA/DoD Aerospace Knowledge Diffusion Research Project is being conducted by researchers at the NASA Langley Research Center, the Indiana University Center for Survey Research, and Rensselaer Polytechnic Institute. This research is endorsed by several aerospace professional societies including the AIAA, RAeS, and DGLR and has been sanctioned by the AGARD and AIAA Technical Information Panels.

This 4-phase project is providing descriptive and analytical data about the flow of STI at the individual, organizational, national, and international levels. It is examining both the channels used to communicate STI and the social system of the aerospace knowledge diffusion process. Phase 1 investigates the information-seeking habits and practices of U.S. aerospace engineers and scientists, in particular their use of government-funded aerospace STI. Phase 2 examines the industry-government interface and emphasizes the role of the information intermediary in the knowledge diffusion process. Phase 3 concerns the academic-government interface and emphasizes the information intermediary-faculty-student interface. Phase 4 explores the information-seeking behaviors of non-U.S. aerospace engineers and scientists from Western European nations, India, Israel, Japan, and the former Soviet Union.

The results of this research project will help us to understand the flow of STI at the individual, organizational, national, and international levels. The findings can be used to identify and correct deficiencies; to improve access and use; to plan new aerospace STI systems; and should provide useful information to R&D managers, information managers, and others concerned with improving access to and utilization of STI. These results will contribute to increasing productivity and to improving and maintaining the professional competence of aerospace engineers and scientists. The results of our research are being shared freely with those who participate in the study.

APPENDIX B: SURVEY INSTRUMENT

PHASE 1 OF THE NASA/DOD AEROSPACE KNOWLEDGE DIFFUSION RESEARCH PROJECT

Technical Communications in Aerospace: A Manufacturing and Production Perspective The SME Study

SPONSORED BY THE NATIONAL AERONAUTICS AND SPACE ADMINISTRATION AND THE DEPARTMENT OF DEFENSE WITH THE COOPERATION OF INDIANA UNIVERSITY AND THE SOCIETY OF MANUFACTURING ENGINEERS (SME)

The f	first group of questions ask about your use of technical information.
1.	In your work, how important is it for you to communicate (e.g., produce written materials or oral discussions) technical information effectively? (Circle number)
	Not at all important 1 2 3 4 5 Very Important
2.	In the past 6 months, about how many hours did you spend each week communicating (producing) technical information?
	(Output) hours per week writing hours per week communicating orally
3.	Compared to 5 years ago, how has the amount of time you spend communicating technical information changed? (Circle ONE number)
	1 Increased 2 Stayed the same 3 Decreased
4.	In the past 6 months, about how many hours did you spend each week working with technical information received from others?
	(Input) hours per week working with written information hours per week receiving information orally
5.	As you have advanced professionally, how has the amount of time you spend working with technical information received from others changed? (Circle ONE number)
	1 Increased
	2 Stayed the same
	3 Decreased
6.	In the past 6 months, about what percentage of your written technical communications involved:
	Writing alone % → (If 100%, go to question 9.)
	Writing with one other person %
	Writing with a group of 2 to 5 people
	Writing with a group of more than 5 people 70 100 76
7.	In general, do you find writing as part of a group more or less productive (i.e., producing more written products or better written products) than writing alone? (Circle ONE number)
	A group is less productive than writing alone
	A group is about as productive as writing alone
	A group is <i>more</i> productive than writing alone
	Difficult to judge; no experience preparing technical information

8.	In the past 6 months, did you work with information? (Circle ONE number)	th the same group	o of people when produc	ing written technical
	1 Yes — → About how ma	iny neonle were in	the group? number of	f people
	2 No With about how			f groups
	Z 140 ——— With about no	w many groups us	d you work. Humber of	groups
	1			
	About how me	noonlo urosa is	anch group? number of	f naonla
	About now ma	my people were m	each group? number of	people
9.	Anneyimately hory many times in the n	act 6 manths did :	vou vimito on muonano the f	fallowing along or in
9.	Approximately how many times in the pa			toffowing afone of in
	a group? (If in a group, how many peop	ne were in each gi	roup:)	
		Times Wrote o	r Drongrad in Dagt 6 Man	·ha

		III	THE WOLLE	LLIL LIIII	1 V			1	,	

Please tell us about your use of specific information sources.

26. Do you use the following information sources in performing your present professional duties? (Circle appropriate number for each)

	Y	es	No
Conference/Meeting papers		1	2
Journal articles		1	2
Technical reports - In-house		1	2
Technical reports - DoD		1	2
Technical reports - NASA		1	2

27. In terms of performing your present professional duties, how important is each of the following information sources? (Circle appropriate number for each)

	Not at all Important				Very Important
Conference/Meeting papers	1	2	3	4	5
Journal articles	1	2	3	4	5
Technical reports - In-house	1	2	3	4	5
Technical reports - DoD	1	2	3	4	5
Technical reports - NASA	1	2	3	4	5

28. If you were deciding whether or not to use conference/meeting papers in your work, how important would the following factors be? (Circle appropriate number)

Not at all Important					
Are easy to physically obtain	2	3	4	5	
Are easy to use or read	2	3	4	5	
Are inexpensive	2	3	4	5	
Have good technical quality	2	3	4	5	
Have comprehensive data and information	2	3	4	5	
Are relevant to my work	2	3	4	5	
Can be obtained at a nearby location or source 1	2	3	4	5	
Had good prior experience using them	2	3	4	5	

29. If you were deciding whether or not to use journal articles in your work, how important would the following factors be? (Circle appropriate number)

Not at a Importa				Very Important
Are easy to physically obtain 1	2	3	4	5
Are easy to use or read	2	3	4	5
Are inexpensive	2	3	4	5
Have good technical quality	2	3	4	5
Have comprehensive data and information	2	3	4	5
Are relevant to my work	2	3	4	5
Can be obtained at a nearby location or source	2	3	4	5
Had good prior experience using them	2	3	4	5

30. If you were deciding whether or not to use in-house technical reports in your work, how important would the following factors be? (Circle appropriate number)

Not at all Important	Not at all Important						
Are easy to physically obtain 1	2	3	4	5			
Are easy to use or read	2	3	4	5			
Are inexpensive	2	3	4	5			
Have good technical quality	2	3	4	5			
Have comprehensive data and information	2	3	4	5			
Are relevant to my work	2	3	4	5			
Can be obtained at a nearby location or source 1	2	3	4	5			
Had good prior experience using them 1	2	3	4	5			

31. If you were deciding whether or not to use **DoD technical reports** in your work, how important would the following factors be? (Circle appropriate number)

	Not at all Important							
Are easy to physically obtain 1	2	3	4	5				
Are easy to use or read	2	3	4	5				
Are inexpensive		3	4	5				
Have good technical quality	2	3	4	5
